

BOWDLEFLODE NEWS 6th Edition 2018

Welcome.

With every Bowdleflode News we bring you interesting facts about Bowdleflodeland and also Planet Earth with features about Endangered Species. In this edition, in mid August 2018, many people are away on holiday until September so

I am going to concentrate on an Endangered Species that you should see every single day in your garden or pollinating fruit trees and flowers.

THE IMPORTANCE OF BEES

Trying to help save Bee Populations.

No Bees .,..... No Pollination

Pollination is the transfer of pollen from a male part of a plant to a female part of a plant, enabling later fertilisation and the production of seeds, most often by an animal or by wind.

In less than 100 years, almost every animal that filled your imagination when you were young could be extinct. Lions, Tigers, Elephants, Rhinos, Gorillas - all may be gone and extinct.

And it all starts with the bees.

They may be small but they are incredibly important to life on earth. Three-quarters of crops we eat depend on pollinators such as bees. They are the building blocks of nature and without them both we and the natural world are doomed.

But if enough people pull together, we can change this. Much is being done to persuading and influence industry, governments, trade associations and pollination experts to work to save them.

The challenge is immense and everything is at stake, but we can succeed. With everyone's help, these little workers can keep feeding us, and our imagination, long into the future.

The Bowdleflode team aim to help all sorts of amazing species so join us and put your own fantasy animal into the Online Bowdleflode Zoo and help us concentrate minds on the fate of Endangered Species on Planet Earth.
